

guidelines for handling the multiple image situation are:

1. There is no pause between images. Each is processed immediately as seen by the decoder.
2. Each image explicitly overwrites any image already on the screen inside of its window. The only screen clears are at the beginning and end of the GIF image process. See discussion on the GIF terminator.

- 1989
- Generally more specific
- Add a “User Input Flag” that rings the bell on the user’s computer for some reason
- Text layers??
